Feature Guide — Product View Tab

Quarter-over-quarter discount and rebate trend, with charts

ONMARK & UNITY GPO

...tracking value, together

What This Tab Shows

History shows how a product's discount and rebate performance has changed quarter over quarter, plus two charts — a quarterly trend and a monthly (daily pricing date) trend — so you can see the shape of the customer's purchasing pattern, not just a single number.

Key Columns

Report Quarter | Agg Level | Discount Type | Discount or Rebate | Common Units Qty | Estimated % | Estimated $ + **History Trend – Quarter** and **History Trend – Month** charts

Real Example: A recent dip worth flagging at Infusion Express

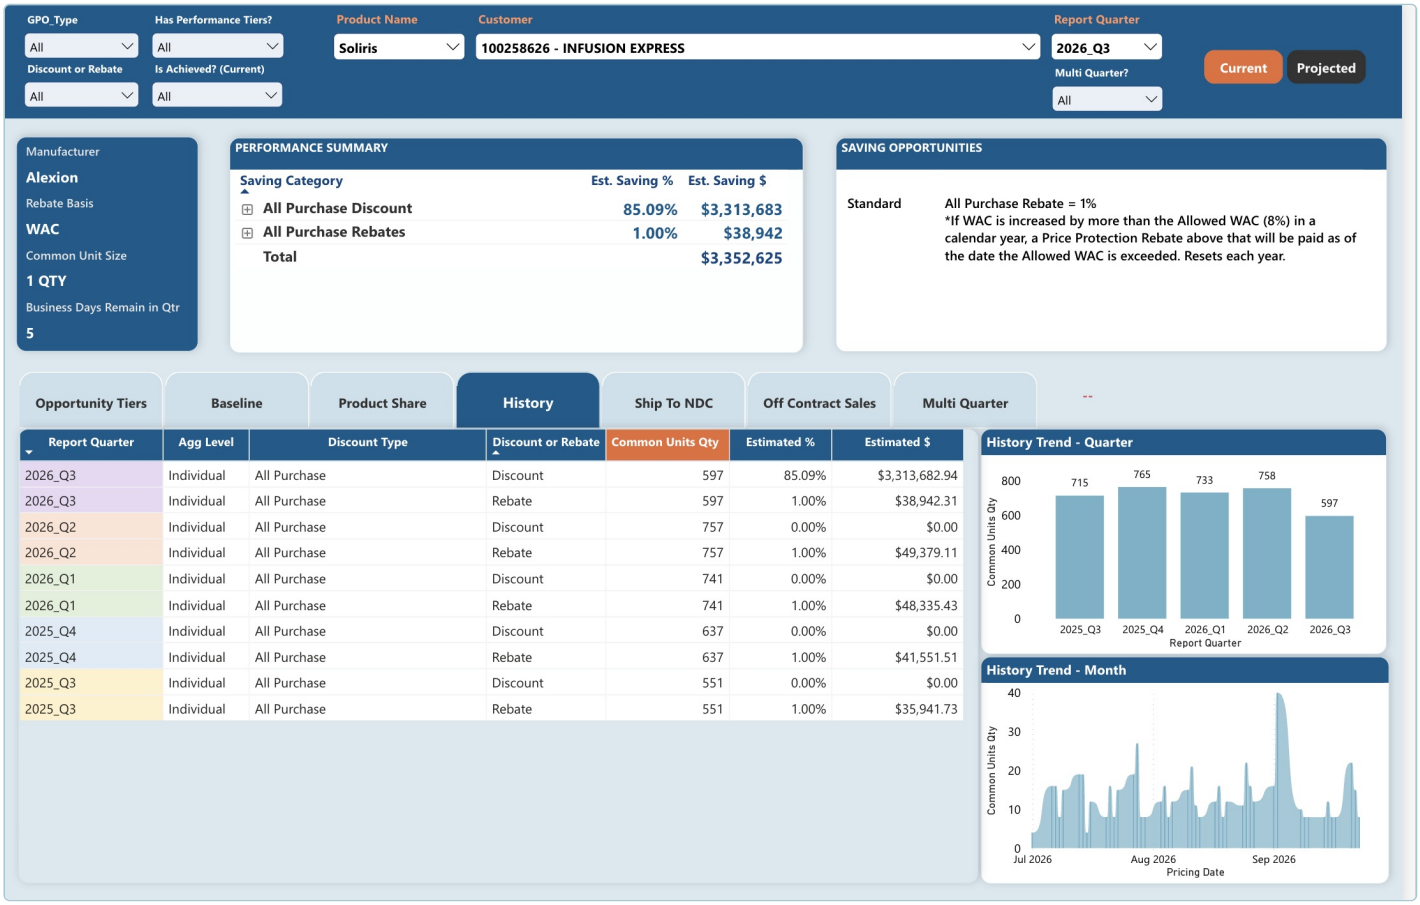

Customer 100258626 - Infusion Express | Product: Soliris | Manufacturer: Alexion

2025_Q3 → 2026_Q3

Common Units Qty by quarter: **551 (2025_Q3) → 637 (2025_Q4) → 741 (2026_Q1) → 757 (2026_Q2) → 597 (2026_Q3)** — three quarters of steady growth followed by a drop in the most recent quarter. Discount % stayed at 0.00% for every quarter except 2026_Q3, which jumped to **85.09%**, while Rebate % held flat at **1.00%** across all five quarters.

Why this matters: A volume dip in the same quarter a discount rate spikes is worth investigating together — it could mean the customer bought less overall but qualified for a much better rate, or it could be two unrelated things happening at once. Don't assume one explains the other without checking the Opportunity Tiers tab for this product.

> **If the customer asks:** "Why did our discount jump so much this quarter?" → Check whether a tier threshold was crossed on the Opportunity Tiers tab — a large jump from 0.00% to 85.09% usually means a major tier change, not a gradual trend.

History tab — Soliris / Infusion Express. Common Units Qty dipping to 597 in 2026_Q3 as Discount % jumps to 85.09%.

Reading the Trend Charts

The **History Trend – Quarter** chart plots Common Units Qty by report quarter — a quick visual for whether purchasing is growing, shrinking, or holding steady. The **History Trend – Month** chart shows the same units by actual pricing date, which reveals purchasing spikes (e.g., end-of-month stocking behavior) that the quarterly view smooths over.
